ABSTRACT OF THE DISCLOSURE

A toilet includes a toilet bowl with a toilet seat made of a swivellable seat panel and a swivellable toilet lid as well as a wall-hung urinal which can be closed by a lid. A casing with a device for emitting acoustical speech and/or music information is placed fixed or removable by a support to at least one of the movable parts of the toilet or of the wall-hung urinal externally or internally. The casing includes a programmable or preprogrammed speech and/or music module or a chip card containing the speech and/or music information with a microprocessor control. The device is connected with a mechanically or light-optically controlled on-off switch or a motion detector in such a way that, when lifting the toilet lid and/or the seat panel and/or the urinal bowl lid, the putting in and out of action of the speech and/or music module is released by the reproduction of the speech and/or music recording.
